

## REMARKS

In follow-up to the Amendment filed February 13th, and in further response to the Office Action of October 13th, Applicant submits this Supplemental Amendment in order to further emphasize the presently claimed invention over Howell U.S. Patent No. 6,899,442 (“*Howell*”).

Specifically, each independent claim has been amended to recite that the subassembly includes an elongate member that is mounted to the swivel member for movement relative to the swivel member about a first pivot axis, and is mounted to the mounting member for movement relative to the mounting member about a second pivot axis. This results in connection of the display (14) to the second arm (10) for movement about the sequence of a swivel axis (30), then a pivot axis (36), followed by another pivot axis (38). In contrast, *Howell* discloses a display (67) mounted to a “second arm” (66) for movement about the sequence of a pivot axis (132), then a swivel axis (138), followed by another pivot axis (140). The order of the sequences—and the consequent resulting ranges of motion—are different, and nothing in *Howell* discloses or suggests the specific sequence of the recited claims. Applicant therefore submits that the claims stand in condition for allowance, and Applicant respectfully request the passing of the present application to issue.

In order to facilitate prosecution, it is respectfully requested that the Examiner contact the undersigned if any further action is deemed necessary by the Examiner in order to gain allowance of the present application, and if such further action may be accomplished through an Examiner’s amendment or otherwise.

Respectfully submitted,  
TILLMAN WRIGHT, PLLC
